

MC215: MATHEMATICAL REASONING  
AND DISCRETE STRUCTURES

- Friday, 10/17/08
  - From last time:
    - Strings
  - Today:
    - Relations
- **HAND-IN HOMEWORK #3 WILL BE ON THE WEB LATER TODAY**
- **READING:**  
3.3
- **EXERCISES:**
  - pp. 158: 20-23, 32 (see text for defs. of  $R^{-1}$  and partial order)

Friday, 10/17/08, Slide #1

Relations on sets – the basic idea

Let  $S = \{1, 2, \dots, 10\}$

- Ex. 1 – a *function* as a relation:
  - $f: S \rightarrow S, f(s) = \lfloor s^{1/2} \rfloor$
  - $f(1) = 1, f(5) = 2$ , etc.
  - We could say 2 is related to 5 (since  $f(2) = 5$ )
  - But 1 is *not* related to 7 (since  $f(1) \neq 7$ )
- Ex. 2 – *order* as a relation:
  - The operator " $\leq$ " on  $S$
  - $3 \leq 5$ , but  $4 \not\leq 1$
  - We could say "3 is related to 5 (by  $\leq$ )"
- Ex. 3: Sharing a particular property (*equivalence*)
  - On  $S$ , the property of "having the same parity"
  - 1 has the same parity as 9, 6 has the same parity as 2
  - 6 is related to 2 (by parity), but 3 is not related to 4

Relation – formal definitions

- **Def. 1:** A *relation R on a set S* is any set of ordered pairs from  $S$ .
  - I.e., a relation **R** is any subset of  $S \times S$ .
- **Ex:** With  $S = \{a, b, c, d, e\}$ , define  $R = \{(a, c), (b, d), (c, e), (a, e)\}$ 
  - We say "a is related to c", or "**a R c**," but c is not related to a – order matters.
- **Def. 2:** A *relation R from a set S to a set T* is any set of ordered pairs in  $S \times T$ .
- **Ex:** R from  $\mathbf{Z}$  to  $\mathcal{P}(\mathbf{Z})$  by:  
 $(n, A) \in R$  if and only if  $n \in A$ .
  - $(3, \{1, 3, 5\}) \in R$ , but  $(4, \{1, 3, 5\}) \notin R$

## Some common examples

- For  $S = \mathbf{R}$  (the real numbers), the relations
  - $=, \leq, \neq, <$
- For  $S = \mathcal{P}(\mathbf{R})$  (all subsets of  $\mathbf{R}$ )
  - $=, \subseteq$ , "same size"
- For  $S = \mathbf{N}^+$  (the positive integers)
  - $a \mid b$  ( $a$  divides  $b$ ), "same parity," "relatively prime"
- For  $S$  a set and  $\mathcal{P}(S)$  its power set
  - $\in, \notin$
- For  $S$  and  $T$  any sets, and  $f: S \rightarrow T$  a function
  - $R = \{(s, t) \mid s \in S, t \in T, t = f(s)\}$
  - Any function-relation has the property that for each  $s \in S$ , there is a unique ordered pair  $(s, t) \in R$

## Some properties of relations on $S$ (not $S \times T$ , where $S \neq T$ )

- A relation  $R$  on  $S$  is **reflexive** if, for all  $s \in S$ ,  $s R s$ , i.e.  $(s, s) \in R$ .
  - On previous slide, which relations are reflexive? (first 3 examples only)
- A relation  $R$  on  $S$  is **symmetric** if, for all  $s, t \in S$ ,  $s R t$  if and only if  $t R s$ .
  - On previous slide, which relations are symmetric?
- A relation  $R$  on  $S$  is **transitive** if, for all  $s, t, u \in S$ , if  $s R t$  and  $t R u$ , then  $s R u$ .
  - On previous slide, which relations are transitive?

## Antisymmetry

- Consider  $\leq$  on  $\mathbf{R}$ :
  - It's reflexive:  $x \leq x$ , for all  $x$ .
  - It's transitive: For all  $x, y, z$ , if  $x \leq y$  and  $y \leq z$ , then  $x \leq z$ .
  - It's *not* symmetric:  $x \leq y$  does not imply  $y \leq x$ .
  - In fact, if  $x \leq y$  and  $y \leq x$ , then  $x = y$ .
- A relation on  $R$  is **antisymmetric** if, for all  $s, t \in S$ , if  $s R t$  and  $t R s$  then  $s = t$ .
  - On previous slide, which relations are antisymmetric?
